

## **Innovative Integrated Treatments for Retinitis Pigmentosa**

Protocol Prepared by Dr. Walter Campbell, DAOM, AP

April 2018

The eye is the only organ that is completely insulated from the rest of the body. The orbit of the eye is like a coffee cup, with the eye being isolated in the cup. A very small hole at the bottom of the cup is the only source of blood flow in and out of this orbit – in other words the eye is completely enclosed in a protective bone cup.

In my clinical experience, inflammatory conditions in the eye are self-generating. The inflammation can increase quickly or sometimes take years to increase, concomitantly decreasing the patient's vision.

My clinical experience has taught me that increasing the blood flow in and out of the eye with homeopathic eye drops and injections at critical acupuncture points around the eye (never in the eye) can benefit the patient's vision immensely.

There are still many unanswered questions about exactly how the visual areas of the Brain work to create visual perception. In visually challenged people, the visual cortex in The brain often replaces color functions by devoting itself to spatial relationships and hearing. I have therefore found it necessary to train patients with a vision loss to see colors all over again, particularly those who have been legally blind for over five years.

Our first Retinitis Pigmentosa patient was declared legally blind eight years before receiving her first treatment. At the start of her treatment, all she could see was white light with a few blurred shadows. She has been treated with homeopathic eye drops and injections since 2016, and can now read again, recognize colors and differentiate traffic lights. Early last year her vision tested 20/800 and four months ago she tested at 20/400.

We are now using four clinical protocols in treating the eyes of our visually impaired patients:

1. Acupuncture applied at traditional points to help nourish the eye,
2. Oxygenating ionized water in a benign gaseous form (or brand name Watt-Ahh<sup>®</sup>),
3. Homeopathic eye drops and homeopathic injections to improve blood flow,
4. Nutraceuticals such as Bil Lutein and Iplex (made by Standard Process),
5. Water Ion treatments.

My hypothesis is that these protocols all work in harmony to return blood flow, neutralize toxins and provide a nutritional platform to help regenerate the eye. This symphonic synergy revitalizes the eyes to help improve the patient's vision.

The WIT<sup>®</sup> Machine that produces the gas represents revolutionary new technology which converts liquid water into a high-energy gaseous form using a unique electromagnetic process. This process delivers oxygen directly to the body in a form which has been producing remarkable results when inhaled through a nasal cannula and directed specifically to the eyes.

Our clinical experience indicates that four two-hour gas treatments over four consecutive days or two weeks can drastically improve vision in most patients who are not legally blind.

The homeopathic eye drops are made from approximately seven to nine injectable homeopathic remedies which are completely benign. Our experience since combining the use of homeopathic eye drops and injections with the infusion of the gas strongly suggests that this shortens the length of time of the healing response and the time needed to return to full color vision.

Researchers who conducted the National Health and Nutrition Examination Survey in Korea described four states of retinal cell health:

- 1) A healthy retina cell that can maintain vision;
- 2) A partially functioning retina cell that provides dull vision;
- 3) A dormant retina cell that provides no vision but can be revived;
- 4) A necrotic retina cell that is functionally dead.

In addition, there are debates on whether the eye can contain stem cells. An argument can be made that if the eye does not have stem cells it will be the only organ in the body that doesn't.

The ionized water gas has been documented to regenerate tissue at a level not previously thought possible, and the unique construction of the eye is very compatible with this healing modality.

The front of the eye is protected by the cornea, which is truly unique compared to other tissues in the body. There is no known blood supply in and out of the cornea, and it is completely responsive to the tears that nourish it with every blink of the eye. In a nutshell, the cornea is completely water soluble and therefore very susceptible in a benign way to the gas that is sprayed gently over the eyes.

The results we are seeing may be all or some of the following:

- Inflammation is reduced.
- Blood flow is returned to the eye, the dormant cells are rejuvenated.
- The stem cells of the eye begin to differentiate and become functional.

In every case study, it appears that night vision is returned first. Coincidentally, the progression of RP begins with the loss of night vision.

## **Healing hypothesis**

The gas is diffused through the cornea via its highly ionized electrons which mimic the same electrons that are liberated by the body's own mitochondria.

The gas enters through the cornea into the interior and posterior chambers of the eye which are filled with aqueous and vitreous humors. These substances are largely composed of water and are very compatible for the diffusion of the gas, so now we have humors that are charged with the same energy of the body and highly energized oxygen which comes in contact with the

retinal ganglion cells of the eye (a type of neuron located near the inner surface of the retina), thereby nourishing every tissue in the eye.
